

Meeting the specifications

1. The website meets the requirements of a home page (index.html). Has images, a unique structured layout, and uses the header main footer formatting.
2. Includes 5 pages with content (about, research, resume/cv, awards/grfp, and contact page)
3. Consistent navigation at the top of every page, it is the same everywhere. Actively highlights itself using javascript
4. Consistent footer at the bottom of page (mellinger enterprises)
5. External files ... css and javascript files are separated from the html files

Interactive javascript functionalities

1. Active navigation
 - a. Detects the current page and highlights it in blue. Also fades in, pretty cool. Uses the .active style
2. Live character count (contact page)
 - a. Displays X / 1000 characters while typing. Doesn't allow user to go over a thousand characters in their message
3. Dynamic helper text based on message topic (contact page)
 - a. Uses a <p> element with text to list multiple options using a dropdown guide.
4. Form validator (success or failure with feedback)
 - a. Checks required fields, validates email format, provides error messages, and displays success if contact form is filled out correctly

Crap principles

1. Contrast: Distinctive hierarchy for pages, dark text over a light professional background. Clear button hover states
2. Repetition: Consistent colors, recurring layout for all pages, good spacing and style across all pages
3. Alignment: Use of grid to ensure clean alignment of sections, images, and fields
4. Proximity: All items are properly aligned and spaced out evenly

Feedback and Improvements

1. Added more descriptions and filled out the page with more information (at the time of the peer eval, there was a lot of information missing)
2. Improved the layout and added a horizontal black bar to separate the h1 element from its below elements
3. Added photos to meet guidelines and fixed spacing

Stakeholders, effectiveness, future plans

This website is designed for a real person who is going to be using this site beyond this course. While the site isn't perfect, doesn't have the biggest descriptions, or have enough pages (that my client wanted) ... This site was developed carefully and with the guidance of Kamber (the client). As you can tell by the site, she is a PhD student and consistently conducts research on

biological topics. She is a real stakeholder and really needed this website. **She is a scientific researcher applying for competitive grants and showcasing her portfolio.** The site communicates her research, awards, and more. It also gives people a contact ability in a clean and professional manner. This site will be served with the purpose so that other researchers can see her work in the academia field.

In the future, I plan to expand the Research and Awards sections, embed publication links, add a blog/news section for research updates, and refine branding to support academic visibility. A custom domain and analytics integration are also in consideration as the site continues to grow with her career.

I had a lot of fun building this project for Kamber. There were some hiccups, like what she wanted the site to look like and getting information from her, but in the end ... she ended up liking the project enough to ask me to keep working on it and even set up her own website. I will eventually take this project, make it a zip file, and send it to her.
